

National University of Computer & Emerging Sciences, Karachi Spring-2019 CS-Department

MidTerm 1

25th February 2019, 9:00 am - 10:00 am

Course Code: CS205	Course Name: Operating Systems			
Instructor Name / Names: Dr. Hasina Khatoon, Nausheen Shoaib, and Tania Iram				
Student Roll No:	Section No:			

Instructions:

- Read each question completely before answering it. There are 3 questions on 2 pages.
- In case of any ambiguity, you may make assumption. But your assumption should not contradict any statement in the question paper.
- All the answers must be solved, such that, the entire question is in one sequence.

Time: 60 minutes. Max Marks: 60

Q1: Answer the following Questions:

[Marks=30]

- i. What is the purpose of virtualization in operating systems?
- ii. What are system calls? Give at least two different examples of system call.
- **iii.** What are the advantages and disadvantages of using the microkernel approach of design of operating systems?
- iv. What are CPU bound and I/O bound processes?
- **v.** When does a process move from Running to Waiting state and from Running to Ready state?

(6)

- vi. What operations are performed during context switching of a process?
- vii. Differentiate between long term and short term schedulers?
- viii. Differentiate between preemptive and non-preemptive scheduling algorithms?
- ix. Which CPU scheduling algorithm(s) may cause starvation of processes?
- **x.** Differentiate between Ready queue and Disk queue.

Q2: Given the following piece of code:

```
main(int\ argc,\ char\ **\ argv) {
int\ child=fork();
int\ c=5;
if(child==0) {
c+=5; }
else {
child=fork();
c+=10;
if(child)
c+=5; }
```

How many different copies of the variable c are there? What are their values?

Q3 (a) Given the following processes with their next CPU burst and arrival time. Give Gantt chart using the following scheduling algorithms: (8)

Process	Next CPU burst	Arrival Time	
P0	10	0	
<u>P1</u>	15	<u>2</u>	i. Shortest-Job-First (Use
<u>P2</u>	5	4	preemptive scheme).
<u>P3</u>	4	6	ii. Round-Robin (Time
<u>P4</u>	12	8	Quantum = 5msec)

- Q3 (b) Calculate the average waiting time and the average turnaround time for each of the scheduling algorithms mentioned in (a) above. (8)
- Q3(c) Using preemptive priority-based scheduling, give the Gantt chart and calculate the average waiting time for the following priorities where 1 is the highest priority: (8)

$$P0 = 5$$
; $P1 = 3$; $P2 = 6$; $P3 = 4$; $P4 = 1$
